

a read unit which reads out from said memory a record list corresponding to a recording media identification signal recorded on a recording media loaded into said recording/reproducing apparatus;

an output unit which outputs a record list read out from said memory to a display apparatus;

a selector which allows selection of a video signal from the record list displayed on said display apparatus;

a searcher which searches a recording position of the selected video signal on the recording media; and

a reproducing controller which controls reproducing so that the selected video signal is reproduced automatically when the search is finished.

12.(New) A recording/reproducing apparatus according to Claim 11, wherein the identification signal unique to said recording/reproducing apparatus is a manufacture identification number of said recording/reproducing apparatus.

13.(New) A recording/reproducing apparatus, comprising:

a recorder/reproducer which records/reproduces a video signal and a recording media identification signal including an identification signal unique to said recording/reproducing apparatus on/from said recording media;

a memory which stores said recording media identification signal and a record list including a day of the week and time when a video signal is recorded on the recording media;

a read unit which reads out, when a recording media is loaded into said recording/reproducing apparatus, from said memory a record list corresponding to the recording media identification signal recorded on the recording media thus loaded; and

a recording controller which controls recording so that a video signal is recorded on the recording media on the same day of the week and time as that included in the record list thus read.
